BUYING GUIDE

People often buy collected shrubbery (plants dug from woods) instead of nursery grown stock because of the low initial cost. However, losses after the first year generally prove that it is not such a bargain after all. Plants commonly collected are: Rhododendrons, Laurel, White Pine, Hemlock, White Dogwood, and Birch.

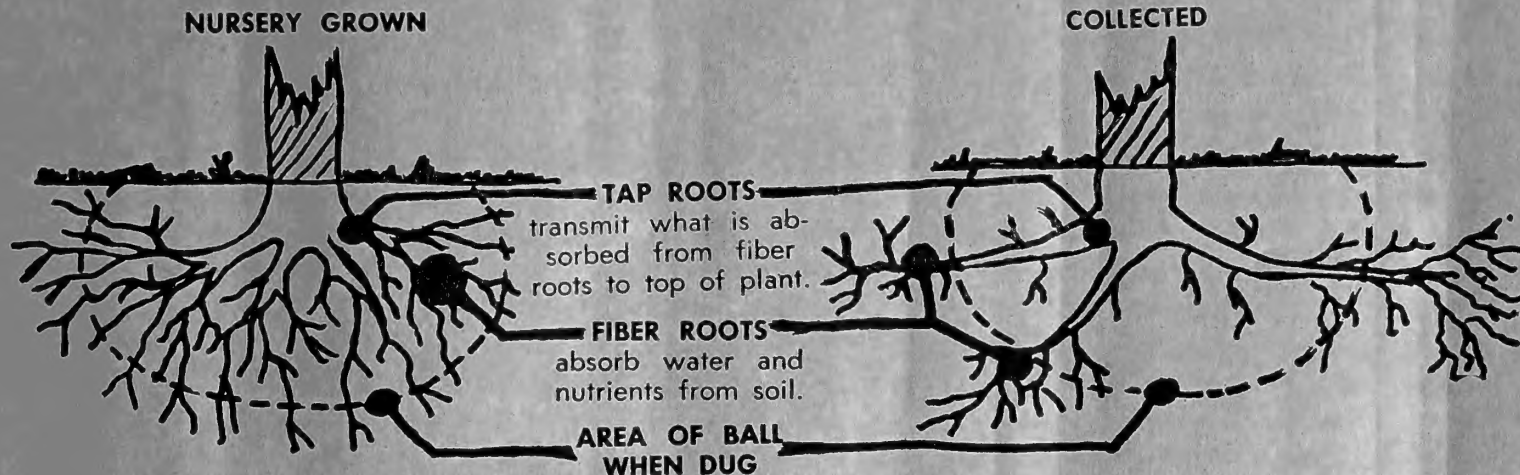

Listed below are the reasons why nursery grown stock, though initially more expensive, is usually in the long run cheaper than collected stock.

NURSERY GROWN PLANTS

1. Nursery grown plants are transplanted one to four times before they are sold. This transplanting promotes the growth of fibrous roots within a limited area, which, when dug, can be contained in the ball. The chances of this plant surviving are much greater than collected stock.
2. Nursery grown plants are sprayed to keep them disease and insect free.
3. Nursery grown plants are kept free of weeds, fertilized and limed to produce a healthy, vigorous root system and top growth.

COLLECTED PLANTS

1. Collected stock has usually never been transplanted. Because of this, the tap roots become elongated and the fiber roots grow farther away from the center of the plant. When dug, most of them are cut off and left in the soil. Therefore, the ball contains very few fiber roots. Without these fiber roots, which absorb water and nutrients from the soil, it sometimes cannot survive harsh winters and dry summers.
2. Collected stock takes its chances with nature.
3. There are no labor expenses involved in growing a collected plant.

HOW TO DISTINGUISH BETWEEN A NURSERY GROWN PLANT AND A COLLECTED PLANT

- | | |
|--|--|
| <ol style="list-style-type: none"> 1. Nursery grown plants are usually well shaped. 2. Nursery grown plants have a good healthy color. 3. Nursery grown plants have a firm, well-shaped ball. | <ol style="list-style-type: none"> 1. Collected plants are many times irregular in growth, but at times are sheared in the woods. 2. Many collected plants have a starved, light green color. 3. Collected plants usually have a flat, loose, irregular ball. |
|--|--|

People may at times unknowingly buy Southern shrubbery (shrubs grown in a warmer climate than ours). Although nursery grown, these plants are cheaper because of lower production and labor costs in the locality. However, when transplanted to the North, they are less able to survive the colder winters. Holly, Ilex, Boxwood, Azaleas, and Hemlock are frequently shipped from the South. It is advisable to ascertain the origin of the stock purchased, and check hardiness of variety.

Rhododendron Hybrids: When buying Rhododendron Hybrids, which are known for their beauty, color and large flowers, be sure you are buying plants raised from cuttings or grafts. These will remain true to the parent plant. Plants raised from seedlings, although they look the same in foliage, often revert back to the poorer flower forms.

Hybrid Lilacs raised from cuttings grow healthier and produce better root systems, enabling them to survive summer heat better than *grafted* lilacs.

Perennials raised from seed instead of cuttings frequently give you irregular flowers, height and shape. This is not desirable where uniformity in shape and color is needed, such as garden borders (Candy-tuft, Carnation.)

Peonies: Buy peonies free from disease and nematodes for the best satisfaction in flowering. Make sure the plant was not grown on potato ground, as this is a common source of nematode. Many peonies on the market today are inferior in flower size, color and ability to withstand storms. This is because they are very old varieties or reverted seedlings. The only peonies that will give you the utmost satisfaction are ones which are of the newest and finest variety. Make sure your peony is tagged as to variety, not just color.

Grass Seed: The quality of the grass seed depends on the amount of annual seed content. Usually, the cheapest seed has the highest amount of annual seed. Annual seed tends to die off, leaving space for crab grass infestation. The best lawn mixture generally consists of perennial seed, which is made up of the type that will grow best in your locality.

DONT'S

DON'T fill hole with water or water with a hose after planting unless you water very gently. A forceful stream of water and watering too fast from a hose causes soil to lose its structure and it becomes hard baked when dry. When possible water gently with a sprinkler.

DON'T water every day. Water gently and thoroughly only when needed. Watering every day, heavily will only ruin the soil structure, impairing aeration and drainage, without raising the soil moisture content much higher.

DON'T plant in solid peat.

DON'T line hole with fertilizer, but mix it well with the soil.

DON'T remove burlap when planting. (Bag will rot rapidly in the soil.) In most cases more damage is done to the plant by trying to remove burlap. When very heavy burlap is used it should be removed.

DON'T untie burlap and push it to the bottom of the hole. This will result in a thick layer of burlap at the base and the plant roots will have a difficult time penetrating it.

DON'T plant in hard pan or sandy, gravelly soil.

DON'T mix sand with a clay soil to improve drainage. SAND + CLAY = CEMENT.

DON'T plant annuals with perennials unless annuals are grouped by themselves. Annuals are vigorous feeders and will weaken the perennials which could result in loss of the perennials.

DON'T feed after June 1st with a high nitrogen organic fertilizer. Most organic fertilizers break down slowly over a long period of time and may feed late into the fall when plants should be hardening off for the winter.

PLANTING LEVELS

Tuberous and thick rooted Perennials such as Peonies, Dictamnus, Hibiscus Crown 2 inches below surface of soil

Rhizome type rooted plants such as German Iris, Iris pumila Top of rhizome at surface of ground

Perennials which leaf from a crown, fibrous rooted, and tap rooted plants, such as
Phlox, Hollyhocks Epimedium, Candytuft Crown on or just below soil level
(This planting level applies to most perennials)

In planting always plant perennials to the previous level. This level can usually be detected by the difference in color above and below the old soil line.

INCHES OF SOIL ABOVE BULBS WHEN PLANTED IN FALL; OCT. 1-DEC. 30

Crocus	3 in.	Snowdrop	3 in.	Grape Hyacinth	4 in.
Tulip	4 in.	Hyacinth	5 in.	Narcissus	5 in.

INCHES OF SOIL ABOVE BULBS WHEN PLANTED IN SPRING; MAY 1-JUNE 15

Tuberous Begonia	1/4 in.	Ranunculus	2 in.	Gladiolus	2 in.
Tuberose	2 in.	Canna	4 in.	Dahlia	4 in.

GENERAL PLANTING AND FERTILIZING PRACTICES

	<i>Inches Soil</i>	<i>Inches Peat</i>	<i>Cupfulls of fertilizer 5-10-5 Per Square Yard. At Planting Mix Well With Soil.</i>	<i>Cupfulls of fertilizer 5-10-5 Per Square Yard. After Planting. Apply On Surface.</i>
Trees	6	1	1	2
Shrubs	6	1	1	2
Narrow Leaf Evergreens	6	1	1	2
Broad Leaf Evergreens	2	1	1	2
Rock Garden Plants	6	1	$\frac{1}{2}$	$\frac{3}{4}$
Garden Perennials, Roses	5	1	$\frac{1}{2}$	$\frac{3}{4}$
Shade Plants	2	1	$\frac{1}{2}$	$\frac{3}{4}$
Peonies	8	1	$\frac{3}{4}$	$1\frac{1}{2}$
Iris	8	1	$\frac{1}{2}$	$\frac{3}{4}$
Poppies	8	1	$\frac{1}{2}$	$\frac{3}{4}$

1. Fertilize all items above, March 15-May 15.
2. Fertilize peonies again September 1-30.
3. Mix fertilizer and peat well with soil when planting.
4. Dig the hole two times as wide and two times as deep as the ball of earth.
- 5.

1. Fill hole to level A with good soil and tamp.
2. Place plant in hole, fill to level B and tamp.
3. Fill hole to level C and tamp firmly.

6. Water gently with a sprinkler until soaked down three feet or more. Don't water again until soil moisture is needed.

OUR NEW CHOICE POPPIES

Adorable—fully double light pink, blooms are seven inches in diameter. Midseason to late	5.00
Bonfire—fire red, midseason	2.00
Burgundy—maroon, early-midseason	3.00
Doubloon—fully double clear orange. Early. Blooms are 7-8 inches across	3.00
Eureka—best light pink poppy. Latest to bloom. Blooms are 8-9 inches across	5.00
Lavender Glory—deep lavender 12 inch blooms. Does not fade	5.00
Lucky—bicolor, white fringed with orange. Large.	3.00
Red Crinkles—deep red	1.25

Master Richard—deep coral pink with 11 inch blooms and stems to 5 feet	2.00
Pinnacle—white and scarlet large ruffled flowers	5.00
Prince Charming—fushia rose, midseason	3.00
Royal Robe—brilliant rose red. Midseason to late	3.00
Snow Flame—available in 1960	
Snow Flake—available in 1960	
Sweet Heart—pure pink	1.50
Sweet Melody—ruffled pink and white bicolor	5.00
Valencia—large 9-10 inches, goblet shaped blooms of clear orange, midseason	5.00
Carmen—red, May Curtis—red, Carnival	2.00

EXPERIMENTAL WORK BEING CONDUCTED AT THE MARTIN VIETTE NURSERIES 1959-1960

1. Tests are being conducted under the supervision of the Cornell Ornamental Research Laboratory at Farmingdale with various chemicals to determine the phytotoxicity of plants and the control of various weeds. Amoben, Eptan, Chloro I.P.C., Simazin, and Karmex D.W. In different concentrations have been applied to a number of different perennials. The results to date have shown no damage to these plants, but not enough time has elapsed to draw any conclusions.
2. Colchicine in many cases may cause a complete doubling and sometimes tripling of the chromosome number in plants. To determine the effect of this chemical on the polyploidy in *Hemerocallis*, colchicine in the concentration of .05%, .1%, .2%, and 1% was applied to the ovaries of *Hemerocallis* at the time of pollinization. Treatments of the above concentrations have been made on

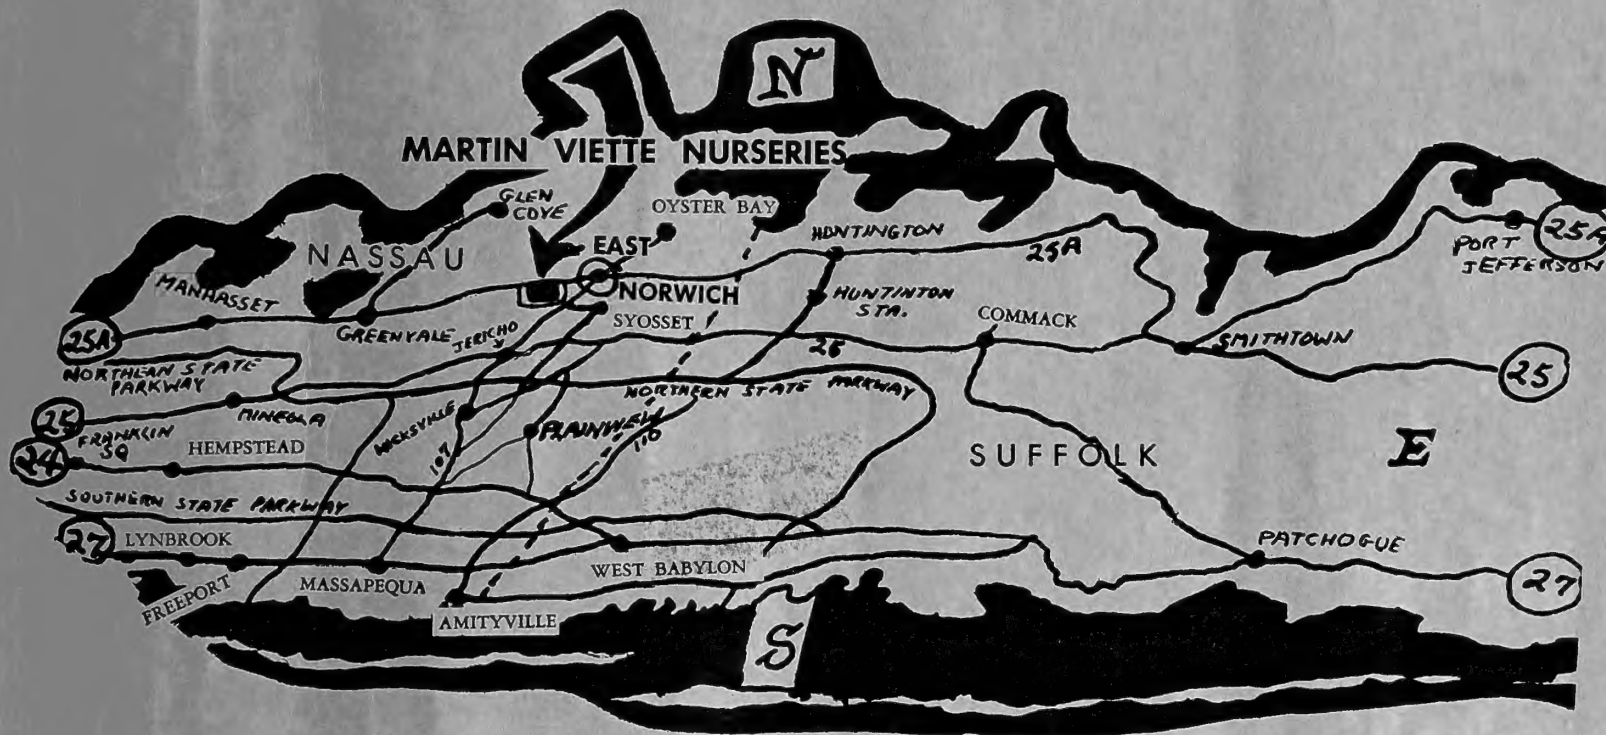

Lupinus Russell's Hybrids, *Aubretia Hybrids*, *Pyrethrum Hybrids*, *Alyssum citrinum*, *Cytisus purpurea*, and *Primula veris* blue seedlings to determine the effects of colchicine.

3. Gibberellin (gibberellic acid, gibberellins A₁ and A₂) is produced by the fungus *Gibberella fujikuroi*. Stem elongation and greater distances between the nodes have been the response of many plants treated with gibberellin. It was felt that this may have an important use in the stimulation of growth of many dwarf and slow growing evergreens and shrubs. In fall 1959 treatments with gibberellin were made on the slow growing *Rhododendron ferrugineum*. Within three months under Greenhouse conditions, the plants had attained the size which is normally reached after seven months. These results have spurred testing of other slow growing plants in 1960.
